

# Windows timezone information for Georgian Standard Time gets forced to incorrect bias

## Description

The custom Tbilisi-4.reg file that we add in our server can be overwritten on third party systems.

## Version introduced

Server 8.0.3.103130

Server 8.0.4.104612

## Platform

Windows Server 2012 R2

## Steps to reproduce

- Install Tbilisi-4.reg
- Observe registry value change.
- Update server to a new version.

## Expected result

- Registry value stays the same (Tbilisi is now +4)

## Actual result

- Registry value is overwritten to default (Tbilisi is +3)

## Work around

- Do not update server once reg is run.
- Or via Client, locate and apply the selection "(UTC+4) Georgian Standard Time", and subsequent remote updates should no longer affect your timezone setting.
