Automatic creation of Service Principal Name (SPN)

Starting with exacqVision 7.2, the server has the ability to automatically create its own service principal name (SPN). A valid SPN is required in order to enable single-sign-on. To enable this feature:

1. Check the box next to "Permission to create SPN" on the LDAP/Active Directory settings page.
2. Verify with your domain admin that the bind account has permissions to create service principal names. If not, this can be granted with the following command by the domain admin:

```
dsacls  "DistinguishedName_of_Service_Account" /G SELF:RPWP;"servicePrincipalName"
```
