

Enterprise System Manager Importer Restarts and Generates "Cannot Assign Group Association" Error

Symptom

The following message can appear in exacqVision System Manager (ESM) importer log files:

```
ValueError: Cannot assign "[DomainGroupEnterpriseGroup: Group Association]":  
"CorruptManagedServerUser.managed_by" must be a "EnterpriseUser" instance
```

This indicates that a user is attempting to synchronize ESM with the exacqVision server, but the connection credentials do not have sufficient privileges.

Affected Versions

This issue was introduced in ESM 3.0.

Workaround

Verify that the server connection credentials has privileges to create and modify users. After changing the credentials, restart the importer service to apply the new credentials.
