

## **Exporting Video as Domain User with exacqVision Client in Windows**

When logged into Windows as a domain user (instead of as a local user), exacqVision Client restricts the locations where video may be exported. An administrative user can export video to any directory or drive, whereas a restricted user can export video only to exacqVision Client's designated file area.

When a Windows system is added to a domain, Windows automatically adds the domain's Domain Admins group to the local system's Administrators group. (Domain Admins is a standard administrative group in Active Directory.) Therefore, by default any domain user that belongs to Domain Admins is seen as an administrative user by exacqVision Client and can choose any location when exporting video. If a domain user is unable to choose a location when exporting video, verify that the user is a member of a domain group that belongs to the local system's Administrators group.

Domain groups can be added to or removed from the local system's Administrators group via the Computer Management control panel, found under Administrative Tools in Control Panel.
